Valued FasTrax Customer,

As of April 8th 2014, Microsoft® will no longer support or provide further security development for the Windows XP® version operating system.

### What does this mean for you?

Since development and support for Windows XP® is ending, your business's PCI Compliance will soon need to be evaluated. If you are not immediately updating to a currently supported OS version, there should be compensating controls available to address risks posed by using unsupported operating systems; however, these are considered temporary and a migration plan to a currently supported OS version should be established. These controls are addressed in the *Addressing Vulnerabilities with Compensating Controls* section of the "ASV Program Guide".

Contact a Qualified Security Assessor should more assistance be required.

### What does this mean for FasTraxPOS?

While you have machines still running Windows XP®, your FasTrax software will operate normally and we will continue to meet *our* direct requirements for PA DSS compliance.

For more information on PCI requirements due to this change, please check [HERE](#) and [HERE](#) of the [PCI Security Standards Council website](#).

Microsoft® also offers guidance for updating [HERE](#).

Before updating your OS, please contact [FasTrax Support](#) to schedule a FasTrax Software reinstallation.

Thank you for your cooperation.

We remain committed in continuing to improve your FasTrax experience!

Best,

FasTraxPOS Technical Support
